Commodore denies 128's death

COMMODORE last week strongly denied allegations that the C128 was being dropped. Acting general manager Chris Kaday told Popular Computing Weekly that the machine was still in production.

The machine is however being heavily discounted in the high streets, with prices of £150-£160, in some cases with bundled hardware and software, becoming increasingly common. A spokesman for London computer dealer Vic Oddens was meanwhile adamant that he had been told Commodore was abandoning

the machine, claiming only the 128D was now being made.

"Our Commodore rep has told us that they have dropped the 128 altogether and that they have discontinued the 1570 disc drive", he said.

Lasky's, Smiths and Boots have all now dropped thge machine, with a Smiths spokeswoman blaming lack of software support for disappointing sales. The compnay cleared stocks with a price cut to £169 in July.

The 128 was launched only a year ago, and at that time was billed as a direct successor

The 128 - forgotten but not gone?

and upgrade to the Commodore 64. Sales have however been patchy, with the 128D with built in disc drive performing better, and the launch of the 64C by Commodore US seems to have been a recognition that the 128 was not a best-seller.

Even if Commodore is not to drop the 128 immediately it now seems likely that more effort will be put behind the 64C and its Geos operating system, with the Amiga and the PC series accounting for the company's efforts further upmarket.

Amstrad PC launch date confirmed

AMSTRAD'S PC is to be called the PC1512, and is to be launched on September 2, the eve of the PCW Show, Recent reports confirm information first published in Popular Computing Weekly on May 29 that the machine will come in four models, with a start price of £399 excluding VAT, and will run DR's Gem.

The machine will run the In-

tel 8086 processor, the gofaster version of the 8088 used in the IBM PC, and will have 512K Ram expandable to 640K. Models will have monochrome or colour monitors and single or double 5½ inch disc drives, and will cost £399, £499, £549 and £649 (all these prices exclude VAT) depending on specification. This gives a retail price of £763,50 for a twin

disc machine with colour monitor, and signs of impending ecstasy on the Stock Exchange notwithstanding this is no longer particularly remarkable in a PC compatible.

The machines will use both MSDOS and Dos Plus operating systems, and Microsoft intends to support them by issuing cheaper versions (£50-£100) of its IBM PC programs.

Memotech's new £198 CP/M micro

MEMOTECH has followed up its successful return from the grave with the launch of a £198 CP/M system. The new model is a development of earlier Memotech models, and is snappily titled the Memotech CP/M 2.2 system. It's basically a 64K machine with built-in 1Mb 3½ inch disc drive and a 512K silicon disc.

The machine comes bundled with an 80 column card. New Word, SuperCalc and communications software, so although it lacks printer and monitor its pricing is comparable to the Amstrad PCW machines. One oddity of the new Memotech is its ability to take a Ram disc expansion up to 4Mb. Keith Hook of Syntaxsoft, which is heavily involved in Memotech software development, explains that a large Ram disc of this sort could be used for databases, backed up to floppy at the end of a session

Acornsoft plans games comeback

ACORN has linked up with Superior Software to prepare the ground for the launch of its new machine, the Baby BBC, this Autumn. The two companies intend to launch what is claimed to be "a wide range of quality — produced software games" under a joint logo.

Acorn software products manager Richard Morris said that "the consolidation of (Acorn's) technical skill and Superior's publishing experience will provide a comprehensive range of entertainment software.

The link-up wil be of crucial importance to Acorn, as BBC software will need some conversion if it is to run on the Baby. The latter uses Atari-style digital joystick ports rather than the BBC-style analogue, although it has Rom emulation to get round this problem.

Similarly it will only take 3½ inch disc software, and is only ADFS compatible, although a DFS transfer routine is being worked on. Basic programs will run, but Rom calls and vectors have been altered so machine code programs will virtually all need some alteration. The keyboard however conforms to the Electron layout, so it may well run some Electron software.

Robtek links up with US firm

ROBTEK has linked up with US company Shanner International in a cross-licensing deal for ST products. Robtek will release Real Time Clock cartridge at the PCW Show as first fruit of the deal, while Shanner will release Robtek's DB Calc in August. Further releases will follow.

New Metacomco Basic ready for ST

A NEW Basic should be bundled with the Atari ST within the next few months, and the odds are on Atari selecting one specially written for it by Bristol software house Metacomco.

According to Metacomco product manager Andrew Spencer, Atari approached his company with the suggestion that it should tender for the contract, "to produce a better Basic". Metacomco's evaluation copy was recently delivered to Atari Corporation in the US.

The company is also to launch several new products for the Amiga and the Atari ST at the PCW Show. The ST products will be the languages Cambridge Lisp, an intepreter with integral compiler priced at £149.95, and BCPL compiler, price £99.95, along with the utility Metacomco Make, costing £49.95. The Amiga products are Metacomco Toolkit, Macro Assembler and Metacomco Shell.

Commodore's little gem

Peter Worlock reviews Geos, the operating environment packaged with Commodore's 64C, in the first of a two-part article

ack in the summer of 1984 I was privileged to see a pre-production version of Digital Research's Gem operating system.

Gem, DR's Graphics Environment Manager, was an independent answer to Apple's Lisa and Macintosh operating systems which employed the now-lamous WIMP (windows, icons, mouse, pointer) interface.

Although Gem was originally designed to run on expensive business computers, and the Mac was selling at more than £2,000, what made WIMPs so impressive was the idea that, one day, all computers might work that way. Since then, many software companies have released products that use the WIMP concept to a greater or lesser degree. Advanced Memory Systems' AMX products are perhaps the best known.

However, with the exception of Atari which commissioned a 68000-version of Gem for its ST series, no other home computer manufacturer has employed a WIMP operating system on its machines (the Amiga doesn't count as a home machine).

However, later in the year Commodore 64 which will feature a new WIMP product called Geos.

Geos – standing for Graphic Environment Operating System – comes very close to turning the 64 into a Mac or ST. Obviously it isn't as fast, nor as powerful, but within the constraints of a 64k memory and an 8-bit processor it succeeds admirably.

Features

The version under review was the standalone implementation of Geos which runs on any 64 or C128 in 64 mode. It will be available in a few week's time and should be identical to the version bundled with the new 64C.

The package comes in three parts: the

It works very well on the desktop, but from within *Geopaint* and *GeoWrite*, the joystick is a pain.

After booting Geos, the screen displays the desktop. The active disc is represented as a notebook with each file shown as an icon – a small pictograph. At the bottom-left of the on-screen pointer here, press the mouse or fire button, and a new page

"An essential accessory is the Preference manager which allows you to set up the desk top to suit yourself"

Geos operating system itself; GeoPaint, an excellent graphics program; and GeoWrite, a word processor. This week we'll be looking at Geos, and next week's issue will feature GeoPaint and GeoWrite.

Geos comes on a double-sided disc. Side one contains the operating system files, the applications programs and a number of "desktop accessories". Side two contains files for different typefaces and printer drivers, plus a communications package for a US database service called QuantumLink.

Geos is controlled by moving an onscreen pointer under joystick control. You can't operate Geos from the keyboard, and while mouse-support is promised in updates of the software, it isn't present in the current version. So you'll have to buy a joystick. appears showing more disc files.

To delete a file, simply pick up a copy of its icon and move it to the wastepaper basket. Copying files is as easy – in theory. Pick up the file from one disc, move it to another, and that's it. In practice, unless you have a twin-disc system, you can't do this and file-copying from the desktop is a laborious process.

Printing a document is also straightforward. Again, pick up the file, carry it to the printer icon, and let go.

Geos will support a range of printers including the Commodore MPS 801 and MPS 1000, Star, Epson and Okidata printers. If there is no specific driver for a given model, you'll generally find that one of the standard drivers will work after a little experimentation.

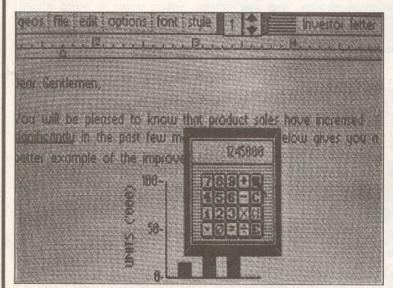

Desktop accessories

Unless you're familiar with the Macintosh, or the ST, or with products like Borland's Sidekick on IBM PCs, the concept of desktop accessories will be new.

The idea is that they replace useful articles found on genuine desktops, so you'll find a clock and calendar, a calculator, notepads and folders for holding documents.

They are available from the desktop, or from within *Geopaint* and *GeoWrite* The most useful are the scrapbooks for pictures and text. By using these, you can build up files of often used pictures, diagrams and special text (such as letter headings) and pass them into word processing and *GeoPaint* documents as you wish.

The last accessory, and an essential one, is the Preference manager which allows you to set up the desk top to suit yourself. You can change the foreground and background colours, the speed at which the on screen pointer moves, and even re-design the pointer itself.

One of the drawbacks of software like Geos is that it often interferes with other programs. Fortunately, Geos is better-behaved than most packages.

Generally, there are two ways to deal with other programs. First, you can quit Geos and load them as normal. Second, you can simply select the program icon from the desktop and Geos will auto-boot it.

When you're finished, pressing the Restore key will re-boot Geos from the disc drive.

While this is a less than satisfactory way of working with your fine new operating system, it will have to do until more companies produce software that supports the Geos environment.

How many companies will do so remains to be seen. One of the reasons for the success (in software terms) of the Mac and the ST is that their WIMP interfaces are part and parcel of the machine, so software companies have little choice but to use windows and icons. On the 64, 128 and 64C this won't do anything unless, a) they have to, or b) there's a lot of money in

it - don't expect too much Geos support from third-party companies.

However, it's not all gloom. The producer of Geos, Berkeley Softworks, has already proved its capabilities with GeoWrite and GeoPaint. Other software is promised and, given the obvious attractions of the Geos envronment, other companies may find they'll have to support it or lose out to Berkeley's own products.

Conclusions

WIMPs are the way of the future. What started with the Lisa and the Mac has gradually worked its way down into the lower end of the personal computer market. The Atari STs, and the Apple II range in the US, are consolidating the position of WIMPs, and Geos may do the same.

It transforms the 64 into a much friendlier system to work with, so much so that reverting back to the 64's own operating system after using Geos is downright irritating.

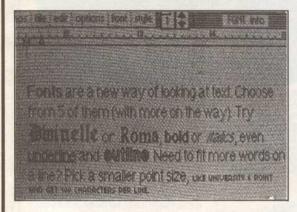

Not that it's perfect. The 64's memory is really too small to do Geos justice. It cries

out for a mouse and one should really be bundled with the package, and although Geos uses some clever software techniques to speed up the disc drive, it ought to be supplied in Rom – on cartridge for the 64 and 128, and built in to the firmware of the 64C.

Moreover, there is no support whatsoever for cassette users. The only way to deal with tape-based software is to dump Geos completely.

Some of the drawbacks will be remedied soon. Berkeley says it is writing mouse drivers, as well as extra applications software. A dedicated version for the 128 should be forthcoming by the end of the year and that should really show off the power of both Geos and the 128.

But even given the questions about how Geos performs as a new operating system, it still represents a worthwhile investment as a software product – thanks to GeoPaint and GeoWrite – of which, more next week.

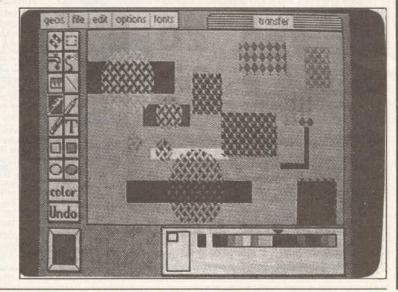

Above left: Geo Write: A word processor with five fonts.

Terminal emulation in C

Leon Heller follows his recent introduction to the C programming language. Here, he shows how to turn your micro (the QL, in this case) into a 'dumb' terminal

n my recent article in *Popular*, June 5, I outlined the main features of the C programming language. The following program, which turns the QL into a simple "dumb" terminal, should take you a stage further, as it is a simple example of the sort of program for which C was originally intended, which would normally be written in assembly language.

It shouldn't be very difficult to adapt this program to run on other machines, with other compilers, and it would be a useful exercise if you are learning C, and can't think of a suitable application. I originally wrote the program for my CP/M system, and got it working on the OL within a few minutes. The basic form of a full-duplex terminal emulation program is as follows:

 i) If a key is pressed, send the character to the remote system.

ii) If a character has been received from the remote system, display it.

iii) Repeat 1 and 2.

The while loop in the main part of the program performs the operations described above. We need to be able to get out of the loop somehow, and one way to do this is to test for the *Escape* key, and quit the program if it has been pressed.

A difficulty with "standard" C as described in Kernighan and Ritchie is that all the input functions wait until a character has been received, whereas we need to be able to alternate rapidly between the keyboard and serial port, so as not to miss characters, hence the need for a *poll* function (provided with the GST QC compiler), which indicates if a key has been pressed.

A similar function for serial input has not been provided, so I had to write one (Serin). All I/O on the QL is bufffered, so the Fflush function has to be used, to flush the buffers, otherwise nothing will be displayed until a new line character is received, or the buffer is full. Fflush shouldn't be needed when using CP/M.

If you use this program on the QL to communicate with another QL, there shouldn't be any problems, provided the two baud rates are the same, and the machines are connected directly, not via modems and the telephone system. The QL tends to lose characters on input, when connected to a simple modem, and a "smart" modem, with buffering, is needed, or a device like the Qcode Modaptor, between the modem and QL. Problems might also rise if the QL is connected to another machine, which uses different codes for new lines - for instance, the QL uses 0A (hex) whereas CP/M machines use a 0A/0D (hex) or CR/LF pair for end of line. This is quite easy to fix, just modify Serin, so that incoming CR/LFs are changed to CRs, and add Serin code to the main while loop, so that outgoing CRs

have an LF added.

outlined the main features of the C programming language. The following ogram, which turns the QL into a simple umb" terminal, should take you a stage

file upload/download; baud rate selection; input/output character translation; half duplex option (characters are displayed as they are transmitted, not when received from the remote system); automatic log on.

```
term

A special preview of Supersoft's Rhythm

Mark Jenkins with micro music news from the British

pologies to those of you who expected a review of the Steinberg Pro 24 package for the Atari 520 in last week's issue. The person responsible has been made to transcribe "Barry Manilow's Greatest Hits" for the Oric Atmos, and you should find the article in this week's supplement.

Steinberg were one of the many companies exhibiting at the British Music Fair, but most of the new software seen at the show was of a highly specilised nature.

Akai, for instance, was showing a package imported from America which allows

"Some inexpensive micro music packages offer advantages which dedicated instruments can't always offer"

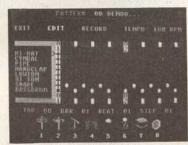

you to visually edit and combine sounds on their S612 Sampler. The S612 costs around £800 with disc drive, is operated over Midi (so you'll need a Midi computer interface or keyboard to play it) and is six-note polyphonic with velocity sensitivity. It's very fast to use and so is a good bargain if you're after computer-controlled sampled sounds; if you have less money to spend but still want near-professional quality I generally recommend the monophonic Microvox sampler for the C64 which also

What the new package adds to the Akai Sampler is the visual editing capability of the Microvox - you can see the wave shape of a sampled sound, edit it with a cursor to remove certain parts or clean up clicks and clunks, and merge several samples together. The package was being demonstrated on an SX-64, which is of course the ideal micro for the musician on the move - if you can still get one.

That example shows how some inexpensive micro music packages have advantages which dedicated instruments can't always offer. Compositional software such as C-Lab and Steinberg's Pro-16 on the C64 and Pro 24 on the Atari have comprehensive screen displays which tell the musician what is going on (in terms of tracks being full or empty, memory space remaining and so on) at all times. Dedicated sequencers such as Roland's new MC500 can do all this, but it sometimes

takes a while to work out which shifted function brings up the information you need in the LCD display!

We mentioned the Microvox earlier and its manufacturers Supersoft now have their latest release, the Rhythm King. It's a Commodore 64/128 cartridge producing sampled drum sounds from a phone socket for connection to a hi-fi or mixer, and has similar menu-driven operation to the Microvox itself (eventually they'll be filecompatible too). Once you've loaded the program disc (it's also available on tape) you'll realise that there are in fact two load-up options giving different drum kit sounds. There are also several alternative demo patterns, but it wouldn't be fair to comment on either sounds or patterns here since neither were final on the copy we saw. Suffice it to say that the finished sounds will probably be pretty impressive, as will the patterns if a spot more imagination is shown.

Rhythm King from the inside...

The four function keys and return (or a joystick) do most of the work and the three main options are Live Play, File Handler and Recording Studio. Live Play allows you to tap out eight sounds from the number keys, the screen going blank as you do so to help with correct sound processing. File handler is pretty straightforward, allowing you to load and save individual patterns and whole songs.

The Recording Studio allows you to create 64 patterns and 16 songs up to 85 steps long (250 on the C128). Mega-Songs can be formed from linked songs to create compositions up to 255 steps long.

Pattern creation is on a helpful grid layout and can be done in real time or step time, although in real time you have to hit the beat very closely to get the note to enter. Quantisation (automatic correction

of your playing), tempo, bar length and number of bars are all programmable, so you can have 5 or 7 beats in a bar if you like, the limit being 24 bars of 32 beats in a single pattern.

A timing click is generated to help you with real time programming and every song can be named during saving. There's a small pot on the cartridge to adjust output level to match your hi-fi or mixer.

Overall the Rhythm King seems a pretty good product, but in terms of development it's some way behind the Tron Digidrum, which now has stacks of impressive sounds including metallic and glass kits, Midi capability and a lot more. Once the Rhythm King with its final sounds is in the shops it'll be easier to give a comparative assessment based on price performance.

How to rescue your shrinking fireman

Tony Kendle looks at CRL's Room 10, gives tips for The Incredible Shrinking Fireman and continues with advice on entering game pokes.

he games that have been giving me VDU eyes for the last week or so are the excellent *Leader Board* golf simulation and *Room 10* from CRL.

Leader Board, as good as it is, has some problems in that it is following on the footsteps of at least three very superb golf programs in the last few months, the latest being Ariolasoft's Golf Construction Set. Room 10 on the other hand, despite references to Pong in the reviews, is like nothing that we've seen before. Like Think!, it is an incredibly simple but completely addictive game that could not exist anywhere except on a computer. It may represent the future of computer games as mass appeal family entertainment much more than the introverted and complex arcade adventures.

What is particularly outstanding about Room 10 is that it is possible to play it with skill, and that's not such a facile statement as it sounds. The early days of perspective 3D games such as Ad Astra were actually

> "Room 10 creates the illusion that you really do see the ball coming towards you"

most difficult because it was impossible to judge accurately when the various objects were lined up – it seemed as if the resolution and graphics abilities of home computers weren't really up to the task. Room 10 proves all that wrong, as by a clever use of changing size and moving shadows it creates the illusion that you really do see a ball coming towards you. Anyway, if you haven't seen it do so as soon as possible.

This week we have a very welcome letter from S Jeffrey of Marsden, South Shields, for all those puzzling over Mastertronic's Incredible Shrinking Fireman. "First of all ignore all objects except the ID card, the red key, yellow key, blue key, the set of keys, the skeleton key, and the five parts of the rack. All of the other objects in the game will just enable you to pass through more screens but only the ones listed actually contribute to you being able to solve the game.

"The complete solution is as follows:

"First travel one screen right and pick up the ID card. Travel nine screens right and pick up the skeleton key. Travel one screen right and three screens up and you can pick up part five of the rack.

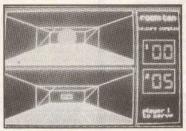

"Now go three screens down again, eight screens left, one screen up, two screens left, one screen up and pick up the set of keys. Travel one screen down, two screens right and drop the skeleton key. Travel one screen right and pick up the yellow key. Travel one screen left, one screen down, nine screens right and drop the set of keys. Pick up the blue key.

"Now go one screen up and pick up part two of the rack. Go back down one screen, six screens left and drop the ID card. Travel five screens left and pick up the red key.

"Travel one screen left, one screen up and drop parts two and five of the rack! Travel two screens right and pick up part four of the rack. Now go one screen down, one screen right, one screen down, two screens right and pick up part three of the rack. Travel two screens left, one screen down, six screens left, one screen up and drop the red and yellow keys. Pick up parts two and five of the rack. Hey Presto! You have now unshrunk Fireman Sid!"

Now to carry on with our beginner's guide to pokes and hacking. Last week we finished with some jargon that explained what machine code was and what we were trying to do with the pokes that are entered, ie, change the number for how many lives you have in the game to as many as possible.

An alternative method to use when hacking a game is to try to stop the game from realising when you have lost a life. To do this involves tracking down the sequence of instructions that work to remove

CRL's Room 10

a life and to replace them with some instructions that do nothing at all. Later on in this series you will learn exactly how to do that for yourself in your own games.

However before we get on to such advanced stuff there are one or two things that we have to sort out about getting pokes in. You will recall from last week that a machine code game consists of a series of instructions to the computer that have to be executed in the correct order, and that this means that the game has to be started from the correct memory address.

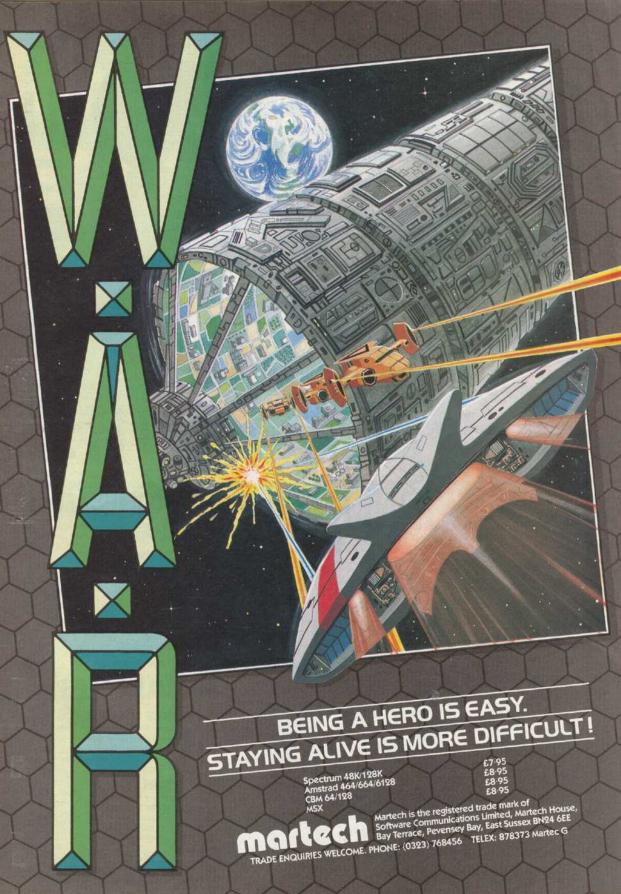

Most games you buy for home computers consist of at least two parts. Part one is a short loader program, normally written in Basic, that does the job of reading the machine code in from tape or disc and which also starts it running by a *Call* to the correct start location.

Unfortunately the situation is slightly complicated by the fact that not all computers use the same versions of the Basic

"An alternative to use when hacking a game is to stop the game realising when you have lost a life"

language – on the Commodore 64 for example the command that is used to start a machine code program is Sys (address) whilst on the Spectrum machines it is Randomise User (address) or Print User (address). However Call is most common and the overall principle is the same.

To get a poke into a game it should be self evident that you must load the machine code in memory and then make any changes you want to before the game has started running. The obvious way to do this is of course to make changes to the Basic loader if there is one, normally which would involve just editing one of the lines, or adding a new line, to insert your new pokes. To achieve this it is necessary to be able to load the Basic part into the computer and then to stop it running on to load and begin the game. This can often be easier said than done and will occupy our attention for a while to come.

Richard Paulin Richard and David Darling - top selling Ofwird games writers, Programmers of the Year 1984, USA Award winners 1985, over 1.5 MILLION games sold to date, including their latest hits - Last V8 and Master of Magic . . . are now expanding their operation and marketing games through their own label.

We will pay £2500 advance royalties for high quality original games.

We are programmers – we know what makes a good, top selling game. If you can write good games, or conversions, we can help you make some real money. We can give any programming assistance you might need and supply music, graphics etc.

If you want to cash in on your talent, contact us now.

THE ATARI MICROS

Steam Engine from the Technicolor Dream demo disc

The Atari machines, both eight-bit and sixteen-bit, offer unrivalled graphics capabilities, superior even to those of the powerful Commodore 64. Technical limitations always seem to compromise the quality of graphics seen in arcade games, so the machines are only seen at their best when used with sophisticated hi-res graphics software.

Packages like Degas and NeoChrome for the ST, the light synthesiser Colourspace for the 8-bit machines and ST, and Technicolour Dream for the eight-bits really show off the capabilities of the micros.

Technicolour Dream, from Red Rat Software, was launched at the April Atari Show, and is an excellent starter program, though with some odd omissions.

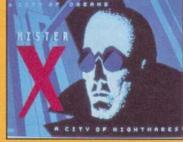

With an initial colour range of 256 shades plus 128 filters, the full palette is remarkable. The colour mixing effects are achieved by using a pair of interlaced screens, one for colour and one for luminance. This gives the pictures an interesting grainy quality which makes them appear almost like real oil paintings.

The program can be controlled using a joystick or touch tablet, which is used initially to choose a colour option from the palette of 256 shades produced on screen. To draw, you press the space bar to access the graphics screen. Both the palette and a help

screen can be accessed at any time.

Options available on the drawing page include line draw, screen fill, luminance change, and the filter options which can help to produce very realistic shading and shadowing. Oddly enough there are none of the usual "circle, box, ray, brush"-type commands which are familiar from many other art packages. In that sense Technicolour Dream is not very user-friendly. But the demo pictures, some of which are shown here, testify to the quality of the graphics which can be produced with practice.

The manual includes a technical section which explains the principles behind the special effects routines. ◀

Comic character Mr X by DEGAS

Colourspace with NeoChrome image

On the more sophisticated side is D.E.G.A.S. for the 520ST, from Batteries Included via Ariolasoft. This is a very straightforward and powerful painting program with a host of advanced functions.

The Design and Entertainment Graphic Arts System, to give it its full title, is remarkably simple to use and comes with a 50-page manual which summarizes all the

commands. The program has one major options menu, with a host of submenus which allow you to define your own colour palette, brush shapes, fonts, airbrush type, reflections, and so on.

The drawing functions are arranged into several groups on the main menu. At the top is a sixteen-colour selection bar, which can be varied by changing the red-green-blue balance using the "set colours" option. Below this is a selection of sixteen brush shapes, ranging from small dots to bars, wedges and diamonds. Again, you can define your own shapes if you require.

The thirty-nine main options

Atari DB-CALC 520 ST, 520 ST Plus, 260 ST & 1040 ST

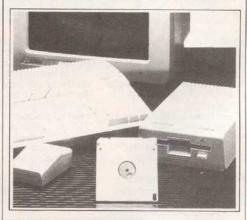

Why spend hundreds of pounds organising your home or office life when you can do it for £49.95.

So simple to use no technical knowledge is needed.

An excellent easy to use database with built in calculating facilities specially designed to take full advantage of the Gem Environment and other elegant features built into your ST computer.

- Compatible with the mouse.
- Suitable for customised reports, mailing labels, memberships, sales statistics, stocklists, office and personal records, financial statistics, etc.
- Designed for half megabyte and one megabyte versions – if you upgrade you don't need to create new files as you can expand your existing ones and there is no need to buy more expensive software packages.
- Ready made files for:
 Addresses,
 break even point analysis, cash
 book, labels, quantity discounts,
 print lists, statistics.
- Unlimited number of fields per record.

- Superfast sort and an ever faster search on a field.
- Selects on any combination of fields.
- Built in text editor which integrates with mailmerge.
- Allows all printer control functions.

- Built in calculator to help you work out difficult mathematical formulae.
- Comprehensive manual which can easily be understood.

For further information contact:-

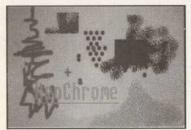

Robtek

Robtek Ltd., Unit 4, Isleworth Business Complex, St. Johns Road, Isleworth, Middx, TW7 6NL, Tei: 01-847 4457

include all the drawing functions you will ever need; lines, boxes, circles, fill, drawing speed, text entry, block copy, airbrush lightness, shadowing, mirror, and a full range of load and save functions. The best thing about DEGAS is that practically everything is user-definable if you do not want to be limited by the preset options. Selected options appear inverse.

Moving to the drawing screen by pressing the right-hand mouse button, a cursor appears and you are free to draw away. All the drawing and fill functions are remarkably fast; functions like the automatic shadowing effect, which can produce shadows of any colour in one of eight directions at a variety of distances form the original, are particularly useful. Also remarkably good is the ability to define your own text fonts, and insert text in a number of sizes on the screen, and the fill pattern definition. There's also a magnify mode which blows up the area of a small box to fill the whole screen for high definition work.

D.E.G.A.S. packs a great deal into a very user-friendly program, and demonstrates the abilities of the ST to great advantage. ◀

More NeoChrome splodges

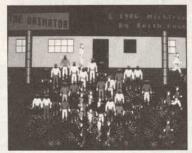

Less advanced, but more familiar (since it now comes bundled with the ST) is Atari's own NeoChrome. This is a much simpler program which features icon selection of functions. The left side of the main menu shows the tools available in a 3×5 grid (although not all of the functions are implemented). The menu can occupy the lower half of the graphics screen, which can save time if you have to switch options frequently, or it can be switched off to devote the whole screen to the picture.

Any of the ST's 512 colours are available, and can be chosen by dragging the colour map from side to side through the colour palette window. Alternatively, you can alter the RGB balance.

The selection of tools is fairly limited; draw, erase, line, fill, brush, spray, text, copy, and various save and load options. The biggest disappointment is that the spray can does not function in the way D.E.G.A.S.'s does, by building up a pattern as you hold the mouse button down; with NeoChrome, is just plops the pattern onto the screen, and is therefore more difficult to use for realistic shading effects. There are also none of the shadowing, font definition, reflection, or many other effects from D.E.G.A.S., but NeoChrome does feature a colour palette

Landscape from Technicolor Dream

Demo from The Animator

animation feature which can scroll through a selection of colours to give an illusion of movement, particularly useful for fire or water effects.

NeoChrome is still under development, but at the moment serves only as an introduction to the ST's graphics abilities.

Interestingly, at least two ST products have already been designed with NeoChrome in mind. One is Colourspace ST, Jeff Minter's epoch-making light synthesiser, the other MichTron's Animator.

Many of you will have seen Colourspace demonstrated at computer shows. It's a psychedelic light-synthesiser which allows you to use the mouse to move a cursor around the screen, select patterns, colour palettes, reflections, gravity effects and backgrounds to create mind-blowing graphic displays. Colourspace is NeoChrome compatible; you can load a Nechrome file into Colourspace to use as a background, then do your own thing with the mouse

over the top (or underneath, or around the side . . .) it's also possible to merge, reduce, reflect or distort the pictures, then save them out again, so Colourspace acts as a "picture processor" as well as a light synth. It's zarjaz, as Jeff would

From MichTron via Microdeal comes The Animator, a complex program which allows you to combine frames and backgrounds created with NeoChrome into cartoon-style animations. You can also convert files from other art packages into NeoChrome format.

The Animator first requires that you create an outline box in which to define your object. This must be a rectangle outlined in white whose interior width is a multiple of 16 pixels. From your master drawings you must produce three masks, one for the details which always remain the same, one for the transparent and opaque parts of the outline rectangle, and one for the area of the outline rectangle to be coloured by the base colour. If that sounds complicated – it is.

The masks are arranged over three copies of the master image, and used to create a mask file. Once saved, you are now ready to animate.

There are ten special animation commands, which allow you to define the order in which the frames appear, how long it appears on the screen, its plane depth, (there are 255 levels available), and its horizontal and vertical position on the screen. The actual speed of the animation is defined at a later stage, once the "movie" has been finished, checked and filed, and you want to display it to the world.

The Animator is NOT remarkably easy to use, and does NOT give staggeringly sophisticated results. But, if you're disappointed by the motionless nature of your graphics package yet can't handle complex programming, it might be the best way to inject some life into your art. ◀

hen you buy one of the new Atari ST computers from Slica op, you will receive a large and varied software package free change. This package covers several applications and com-ses a total of nine titles. All ST's now have TOS/GEM on My, and the total list of free software is as follows:

- ROM, and the total list of free software is as follows:

 J GEM DR Desktop envisionment with WIMF (in ROM)

 21 TOS Trained Operating System in ROM)

 31 st WORD Word Processor by GST using the GEM environment and multiple similaries windows

 41 BASIC Personal Basic by OR (with manual)

 51 LOGO Logo language by DR (with manual)

 61 DODDLE Simple paint/doodle drawing package (works on mono or colour systems)

 71 MEGAROIDS Asteroids type game by Megamus

 81 NEDCHROME A powerful colour systems)

 91 CPM EMULATOR Allows the use of DR's 280 C/PM software to run on any ST system

3rd PARTY SUPPORT
The power and potential of the ST range of computers is causing a flood of new software titles, peripherals and accessories from third party manufacturers. Titles range from word ories from third, party, manufacturers. Titles range from word processing to preadshed programs, from graphics and games to database management - all with those easy drop-down menus and windows. With the lat of companies producing ST software including dozens of top names, you can expect some first class titles for the new ST range. The following includes a selection of the third party manufacturers who have developed, or are working on, products for the ST range.

JACK ROSEBURY ON STATE-OF-THE-ART GAMES, INCLUDING THE PAWN, THE FORTHCOMING STARGLIDER, AND U.S. CONTENDERS SUNDOG AND HEXES

Few programs demonstrate the capabilities of the ST better than Sundog – The Frozen Legacy. A testing combination of strategy, adventure and arcade action, Sundog comes from FTL Software, a Californian outfit.

Sundog incorporates a game principle called ZoomAction. In effect, all this means is that each time you enter a new section of the game, a window opens to show you the interior of the current environment. Before you start, though, you must design a character.

Like many an adventure game, Sundog assigns your character several attributes – intelligence, luck, strength and so on – and you can distribute the points available amongst these attributes. You can also name your character. Games can be saved and reloaded from any point, and since Sundog is so complex you will inevitably need to use this facility.

All the functions can be controlled by the mouse, which controls a cross-sight on the screen. The left button is used to select screen options and move your character in the direction of the sight, while the right-hand button returns to the previous screen or shows your personal status.

The game opens in the interior of your

ship, Sundog. An inheritance from your uncle, the ship is a battle-scarred trading vessel. Your other inheritance is a mission to deliver a cargo of "cryogens" – frozen colonists – to their intended destination. First you have to find the colonists – then you have to find the colony, which could be part of any one of several cities.

Moving around the city is achieved by controlling the cross-hair sight, which your character will follow. Many of the colourful buildings you encounter are just scenery, so it's a matter of trial and error, testing them all to see which you can enter. You will need to find a bank to get some ready cash, an eatery to cater to your bodily needs, and often a police post if you are attacked.

Various shady characters will approach you on the street, at which a window opens allowing you to choose whether to zap them, talk to them or beat a hasty retreat. You can lose a good deal of money trying to get information from ignorant beggars, but at the same time you shouldn't take the risk of missing important information.

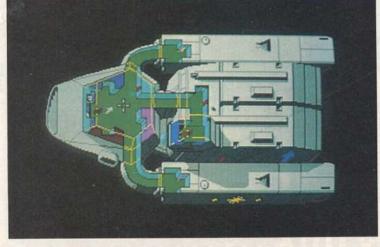

Eventually, the game will require you to leave the planet. You will have to find your way back to your ship, make sure it's fuelled up, and take off for another star system, using long and short-range

Still holding its own in the ST market is The Pawn, a sophisticated text-andgraphics adventure which sets new standards in both technical achievement and game complexity.

Set in the mythical land of Kerovnia, the game concerns, among other things, your attempt to remove from your arm a mysterious wrist-band. In your quest you are helped or hindered by an eccentric cast of characters including The Devil, an unruly Princess, a gaggle of ambitious politicians and a morose snowman.

Although many of these characters will promise you help, you will soon find that most merely want to manipulate you to their own ends – hence the title. However, it's possible to have great fun with The Pawn without actually achieving anything. There are several sub-adventures which you need not complete to finish the game.

What makes The Pawn stand out is the quality of its "parser", the input interpretation routine. Unlike some games which can only accept verb-noun constructions, or which fail to recognize inexact phrases such as "pick it up", The Pawn can deal with very complex sentences in straightforward English. It can also deal with multi-part instructions—"Pick up the key and put it in the hat on the tree stump then of around 150

▶ scanners, weapons systems and various monitors to navigate your way through subspace to your destination, fighting off pirates all the way. Sundog is not a game

words, but it's the quality of the parser which makes you almost forget that you are simply playing computer game. Not to be ignored are the impressive graphics screens, which can be scrolled up and down in windows. The sheer detail and artistic quality of the graphics have to be seen to be believed, although game authors Magnetic Scrolls like to regard them as a bonus in what is basically a very sophisticated text adventure.

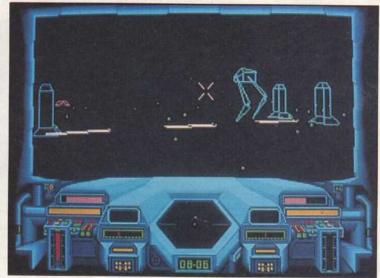

The Pawn is infused with a sense of humour which continuously sends up the whole adventure game genre, but which has apparently gone over the heads of some reviewers. Seasoned adventurers and tyros alike should get a lot out of it in any case.

The Pawn is the first adventure I've come across where the player is not continually frustrated by the limitations of the parser. Versions for ST, QL, Amiga, CBM 64/128, and other machines are available now or on the way. ◀

for the faint-hearted – the sheer scope is immense. The combination of styles means, though, that it is easy to get into and difficult to stop playing.

Coming up from Rainbird is what will surely become a classic arcade game for the ST, Starglider.

Author Jez San of Argonaut software has collaborated with writer James Follett, of "Earthsearch" fame, to produce a scenario in which an intrepid space pilot returns to his home planet to find it overrun by aliens. Your aim is to destroy the Starglider, flagship of the aliens, but to do this you must combat huge Walkers, which stalk menacingly across the landscape, and several varieties of ground and air attackers. You have laser weapons and missiles to protect you, but four missiles must be used to destroy the Starglider – and you can only

The game will include a novella setting the background, but the action is pure arcade excitement, rather than complex strategy.

Starglider relies on 3-D vector graphic animation with full hidden line removal and perspective. From your cockpit viewpoint you will be able to approach any of the alien artifacts from any angle, and still get an accurate representation on your "viewscreen".

carry two at a time.

Starglider includes challenging refuelling and rearming sequences, in which you must pilot your ship very precisely while under heavy enemy fire. Together with sophisticated sound effects, sampled speech and full control panel read-outs, Starglider, scheduled for an August release, looks like being a winner. Conversions for 6502 and 280-based micros are also on the way.

Less impressive perhaps in the graphics stakes, but still a challenging strategy game, is Hexes from Mark of the Unicorn. On first sight this looks very much like a version of the arcade game Q*Bert, with a 3-D board made of coloured hexagons and a series of players moving around it. In fact, Hexes relies on strategy rather than quick reactions; you take alternate goes with the computer, in your attempt to turn all the hexagons one colour.

You control a unicorn, which leaps from hexagon to heaxagon with enviable grace. In opposition to you are a variety of unusual creatures; a triceratops, a jellyfish, a scorpion, a dodo, and so on, according to

the difficulty level.

At the earlier levels, the game is quite straightforward. Leaping on a hexagon changes its colour according to a sequence shown at the top left of the screen. At some points hexagons will only change colours if you complete a whole section in order.

At higher levels things get more complex. The hexagons change colours according to more abstruse principles, and various magic

spells come into use. Your enemy can take control of your player for one go, or split into two or even three places, or conceal the colour of a hexagon. You also have magic spells with which you can fight back.

Overall, Hexes is a combination of traditional mind games like Solitaire and principles more familiar to computer games players - very much like EA's tactical arcade game Archon. Hexes is a thinking game rather than a reflexes game, but takes advantage of the ST's graphics capabilities to produce some very impressive player graphics.

Data sorted by Robtek

POWER WITHOUT THE PRICE IS THE PROMISE OF ROBTEK'S DB-CALC FOR THE ST. FERGUS CARPENTER PUTS IT TO THE TEST

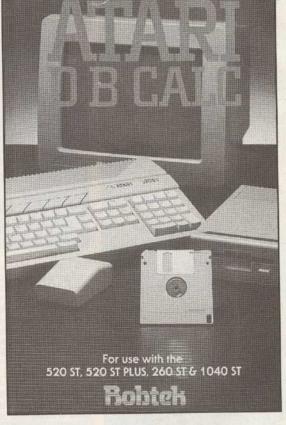

The speed, power and memory capacity of the ST make it the ideal database machine, but up until now suitable software package for the home or small business user have been discouragingly expensive. Robtek's **DB-Calc** aims, like Atari itself, to offer power without the price.

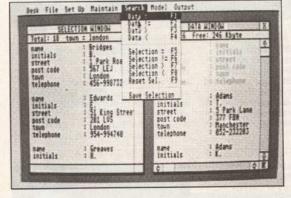

DB-Calc is, as its name suggests, a database with calculation functions. It takes full advantage of mouse control and the GEM environment, with menu selection, pull-down windows, error messages and resizable windows.

Flexible

DB-Calc is a fairly straightforward "cardbox"-type database, but has a remarkably flexible calculation facility. With standard desk accessories loaded, the memory capacity is around 50K – so 2500 records of for N* in the NAME field to find all your contacts whose names started with N.

The Search menu allows you to specify upper and lower parameters for your data search. The Model facility allows you to enter text - say a form letter - and merge it with information from the main data file. It's a simple form of mail merge which could save lots of time and energy in producing

four lines each would be a typical set-up. On the 1040, the memory space available is over 380K.

The main display consists of two work areas, Selection and Data, and seven menu headings. The File heading allows you to load, append to, save files, or quit. The next, Set Up, gives you the choice of inserting or deleting a field, or returning to start condition. Choosing Add Field brings up a window which allows you to enter the name and position of your new field.

The next menu, Maintain, allows you to sort data by field name, edit the data file, or delete selected records. You could, for instance, specify LONDON as the sort parameter for the TOWN field, producing a list of all your contacts in London.

You can also sort by numerical parameters using the hash symbol, and wildcards can be used either numerically or alphabetically – for instance you could sort standard letters to specific clients.

You can make calculations within the model, using the extensive calculation facilities. The special commands used are entered as text input in the same way that you would "program" a more complex spreadsheet. Numbers are shown in floating point notation, the largest being 9.22 E18, the smallest 1.08 E-19.

Variables

You can also use letters as variables, a principle which should come easily to Basic programmers, to produce complex calculations in conjunction with the eleven available mathematical operators; power, multiply, divide, rest after dividing, add, minus, smaller than, larger than, equal to, different to, and assignment. Many standard functions such as square root, log, exponent and so on are also available in DB-Calc.

Apart from the mathematical functions, which would probably baffle the complete tyro, DB-Calc offers ease of use, speed and flexibility. There are several example files provided on the disc, including a cash book, address list, discount log and so on. These make the manual (translated from Dutch, and a little short on practical exercises) much easier to understand.

Overall DB-Calc seems to serve its purpose well; it's powerful enough to satisfy many ST users without costing too much or getting bogged down in complexity.

The Only Publication **Dedicated Exclusively** To The Atari ST

One thing is known about ST owners - they are dedicated, and that's why all ST owners should read ST User the only publication dedicated exclusively to the Atari ST. Concentrating on software reviews and articles discussing how to make using the ST more productive, the magazine is the best guide you will find to this new age of powerful computing. From graphics routines to accounting software all aspects of the ST are explored and in a depth previously never seen in computer magazines. Software reviews are large and detailed and really help to make purchasing decisions a less risky business. However, don't take our word for it either subscribe or send £1.95 for a sample copy and, if your not entirely satisfied, we will refund your money completely.

Issue Seven will be available in the third week of August and back issues are available singly at a cover price of £1.95.

One in a Marillion

MARILLION'S MARK KELLY IS ONE OF MANY USERS OF STEINBERG'S PRO-24 MIDI SOFTWARE FOR THE ST. MARK JENKINS EXPLAINS

Over the last year or so, Steinberg has established itself as one of the most proficient producers of music software in the world. The achievements with the pro 16 package for the Commodore 64 were unprecedented, but for truly professional purposes the Commodore has proved itself a little limited.

The requirements for a music computer are pretty similar to those for a business machine. Reliability is a factor, but speed is every bit as important – while lost time means lost money for the businessman, for the musician it means lost inspiration. There's nothing more frustrating for the

composer than a long wait for a disc to load before being able to record his latest brainwave.

So a fast, reliable computer such as the Atari 520ST/1040ST has been needed before a genuinely professional music package could be developed. In the US the Apple Macintosh has been popular for a while, but the ST actually comes out better in benchmark tests, shares the advantage of the mouse-driven control system, and is of course much cheaper.

The fact that the Atari computers also include a MIDI interface for direct control of musical instruments, is a bonus, although it has some drawbacks in that add-on MIDI interfaces usually include sockets for footswitches, drum machine synchronisation, tape synchronisation and so on. These facilities will probably be added on to the Pro 24 package with a hardware option at a later date.

24-track

So what does Pro 24 offer the musician? The system's laid out as a 24-track tape machine – there are only 16 different channels available via MIDI, but it's useful for various reasons to have a few spare tracks available. For instance, you could record several "takes" of a melody, keep them all separately, and decide which one you wanted to use during the final stages of composition.

Most computer composition packages, including Pro 16 and the very impressive C-Lab package for the C64, depend on the repetition of short sections of music with various mutes and transpositions. In practice these can become quite lengthy, but Pro 24 operates in a slightly different way. The longest section recorded can be as much as 999 bars long, and can be edited in many ways; further sections are laid over it, with each MIDI channel controlling one polyphonic synthesizer, expander or drum machine.

Each of the 24 tracks is marked with a

square at the top of the main screen and each can be put into record mode and set to play or remain silent. The mouse selects Record status and notes are then played from the synthesizer; you can choose to play them back exactly, or with various quantisation (rime correction) values.

Tempo is completely variable, as is time signature, and all recorded tracks can play back as further ones are recorded. If you use a Casio CZ101 or other "Multi-timbral" synthesizer, you can play back several different sounds on several MIDI channels simultaneously from one synth.

Display

One of the wonders of Pro 24 is the amount of information squeezed into the display, which is why a high resolution monochrome monitor is needed (a mediumres colour update will be available free to uses after the British Music Fair). Tempo, Beep (metronome) status, Master Tempo track on/off, Synchronisation status, Memory remaining, Recording Start and End point, Channel and Pattern number, Bar and Beat number are all on display constantly – an enormous help to the composer.

There are also various items of information which the user can enter — such as the name of each piece, the name of each synthesizer connected, and the MIDI Mode and type of note release used for each synth.

Pull-down menus include Desk, File (for song and pattern saving), pattern, Track, MIDI (for creating the basic MIDI setup saved as part of each song), Edit (to go onto the Edit page), and Fast Access for the most important parameters.

The Edit page consists of a grid which indicates every MIDI event which has been recorded. A big chord with lots of pitch bend may fill up the page, whereas simple repeated notes may fit onto the edit page by the dozen. This page also allows you to enter notes in Step Time, although this won't often be necessary considering the power of the real time quantisation

function.

Thanks to the Left and Right locater boxes, it's possible to drop in and record at any point to correct mistakes, and the computer will drop out again at a preprogrammed point. The Track Info box gives detailed information about the contents of each track, showing whether the velocity of recorded notes has been altered and whether the track has been set to record just one or two different MIDI channels to deal with either half of a splitkeyboard sound.

Synthesizer sound changes can be recorded as part of a pattern, as can volumes on some synths such as the Yamaha DX7. Tracks or sections of tracks can be copied and appended to by name, and there's a good selection of error messages if you're trying to record over an existing track or call up a non-existent

track.

Marillion

As we mentioned, there are some problems synchronising Pro 24 to tape, and professional users are buying the Roland SBX-80 unit, costing around £800, to convert SMPTE codes to MIDI clock signals which Pro 24 can follow. There's a cheaper Hi-Tec tape sync unit also available, but it's probably cheaper still to clock Pro 24 from a MIDI drum machine synchronised to tape, or to wait for the add-on hardware interface to turn up.

Professional users of Pro 24 such as Mark Kelly, keyboardist for Marillion, have been very pleased with its performance. Although the system seems imposing at first, apparently it's very fast to use after a little experience, offering a choice of mouse or keyboard control. Its capacity is vast, running to tens of thousands of notes on the 520 and even more on the 1040, which of course has the advantage of an integral disc drive.

It's easy to create a complete song with synthesizers and MIDI samplers using Pro 24, although of course you'll need to have the system synchronised to tape if you want to record vocals, guitars or other instruments. But as a complete professional music package, Pro 24 has few rivals in the world at the moment, and virtually none at the price. ◀

Transmat's many features include

 Easy Operation - Auto or non auto modes.
 Relocator for programs which overwrite the disc area - Erase - Catalog files - Rename - Disc header reader - Select user area - A or R drive working - Transmuts likelt. B drive working • Transmats itself. Also available on ROM only £19.95.

The perfect advanced software complement to Transmat for those knowledgeable in computing—Spirit offers all the tools you need in one economic package to transfer those genuine headerless programs onto

To use Spirit you need a dissassembler and some knowledge of machine code

PRINTER PAC 11

The screen copier. The complete printer utility for most popular dot matrix printers, including the DMP 2000 • Full proportional shading • Full size dumps • Variable buffer option to release the computer • Text dumps • all models catered for.

SUPER SPRITE Creates fast moving animated games easily. An extremely powerful and versable piece of software at a realistic price. SUPER SPRITE is a menu-driven friendly program which will offer you hours of enjoyment designing your own sprites. Included is a demo to show you the possibilities of designing and writing your own animated software. The complete instruction book gives examples of how to create and animate sprites for your own programming

STATE OF THE ART

Working with the Atari ST by David Lawrence and Mark England shows you how to harness the considerable computing power of the Atari ST, getting the 'power without the price' working for you.

- Topics include the ST's main system, GEM, BASIC, LOGO and the BOS Operating System.
- The Atari offers considerable computing power that was previously only available on much more expensive machines. If you want to learn exactly what use that power can be put to, then read this book.

Space War on BBC

by Mark Ward

his is the first part of a three week listing of Space War. Next week features more of the listing plus the first part of the instructions.

If you can't face typing it all in then send £3 to Mark Ward, 43 Wordsworth Road, Hampton, Middlesex for a copy of the game on cassette.

Your home world lies in ruins, destroyed by the Zargoids, and you and your thirty ships are the only survivors of the attack. For many desperate months you have tracked the marauding aliens across the length of the galaxy. Now you have finally

brought them to battle in a remote rim section of the galaxy, where few stars are left to light the night sky. This is your chance for revenge... or oblivion. Only you can put an end to the evil Zargoid menace.

The two fleets are fairly evenly matched. Each consists of thirty ships, although the make-up of each fleet is different. The Zargoids for instance have more H.Q. ships than you. Your only hope of winning the battle is to seek out and destroy the enemy H.Q. ships. Be careful though, the Zargoids have the same thing in mind!

There are seven types of ship in all, each with it's own graphic character.

Amstrad Alert

If you're the owner of an Amstrad CPC 464 or 664 micro and would like to learn more about either machine code programming or musical applications, then send off for one of these exciting new Sunshine books today.

lan Waugh has written Laking Music on the Amstrad CPC 464 & 664 to show you how to take full advantage of the excellent sound facilities of the Amstrad. These include no less than three sound channels and the ability to program your own volume and tone envelopes into the sound generator - you can produce sound effects, drum kits and even program your Amstrad to write its own compositions following the rules you give it. And if you can't face typing in the longer programs, there's a cassette available with all the program listings on it.

With machine code you can really get your Amstrad working. In Master Machine Code on your Amstrad CPC 464 & 664 Jeff Naylor and Diane Rogers how to begin to program in machine code, building up to the development of a complete database program which illustrates most of the relevant machine code techniques. There's a chapter on adding your own custom-made commands to Locomotive BASIC, and the authors show you how to make the best use of the excellent firmware routines in the Amstrad ROM.

Send off today and see a new side of your Amstrad.

Three Amstrad queries

P J Long of Bedminster, in Bristol writes:

Q Firstly, can I use an Amstrad 464 with a 6128 monitor by ignoring the disc lead?

Secondly, I read an article that said the Commodore 64 disc drive is sure to break because the protection on the disc hits the reading head, in time pushing it out of position. Is this true of the Amstrad disc drive?

Thirdly, bearing in mind that I would like to stay with Amstrad, would you recommend that an upgrade to the 6128 is a good move with a view to the future?

A Three questions in one, eh? Well, here goes.

Firstly, yes you can use the Amstrad CPC 464 with the CPC 6128's monitor as both the green screen and colour monitors have the RGB Din and power leads coming out of them. With regard to your last question, if funds allow, it may be an idea to obtain a colour (if you have green screen) or green screen (if you have colour) monitor with the upgrade, to give you the best of the Amstrad for both business and pleasure.

Secondly, the nasty 'Brrdddd' that the Commodore disc drive makes when it comes across protection may put it out of line eventually bût it will take a while. As far as I know, at the moment, protection routines and disc drives for the Amstrad drives work in a different way to those of the Commodore and don't do nasty things to the drive.

Thirdly, what you will have to consider when upgrading with the Amstrad is what you are

upgrading for. If you want to use some of the business packages then you may need to consider the 8256 or 8512 machines. If it's just for games and faster loading times, the 6128 is the better bet. Bear in mind that three weeks into August should see the launch of Amstrad's IBM PC which should be quite cheap. There is a lot of software available for PC clones (if they are truly compatible) both business and games so you might want to wait and see.

Communications via VIA chips

S Hughes, of Llandudno, in N. Wales, writes:

Name a BBC micro, and i want to connect it to the outside world by means of the VIA chip in the user port. There are a number of registers only some of which I know enough about to use (see page 437 of the user guide). Could you give me some more information on the 6522 VIA chip and what the various registers do.

A On the BBC, the 6522 is situated at FE60-FE6F giving access to all 15 of its internal registers. To perform simple I/O, only port B and its controls need be used. If you want to use the chip to its fullest extent, you'll need to get a book on the subject (there's not enough space here to detail the complex workings of all the various registers). The basic port B controls are:

Reg 0&FE60: I/O register B, can be written to or read, depending on the contents of data direction register B (DDRB). Simply V=?&FE60 or ?&FE= 192.

Reg2&FE62: DDRB, sets the direction of I/O port B. Bits set to 1 denote output, 0 is input. The lines on port B can be a selection of both input and output, eg, ?&FE62=15 sets the bottom four lines for output, the top four for input.

Page 503 of the user guide shows the pin connections for the user port. All you need to

do is buy the appropriate connector and some prototyping board (Maplin and Tandy both sell this; it allows wires and components to be plugged in, taken out, tested etc). the main thing to watch out for when experimenting is that you don't connect the 5V output line of the BBC to ground, this blows one of the BBC's internal fuses.

For more information of the 6522 VIA in conjunction with the BBC, get a copy of the Advanced User Guide for the BBC Micro, (publishers' details to come).

Disassembler on the BBC

D Charles of Cardiff, in S. Wales, writes:

For some time now, I have been wanting to write a machine code disassembler for my BBC micro. Could you give me some hints on how to go about it? I understand and know how to use the assembler so machine code is not too much of a problem.

Since speed is not really a Aproblem with disassembler. its easier to write it in Basic. The first thing to notice about 6502 machine code is that each instruction has its own particular identifying number eg CPM #10 is C9 (hex). A disassembler program needs to know the addressing mode as well as the mnemonics and their value, since this then tells it how many bytes need to be extracted from the code being disassembled, eg LDA &1234 extracts three bytes. The first is the opcode &AD (defines LDA Absolute) the following two give the address in low byte, high byte format. So, the code the disassembler would see is: AD3412

A simple method to do this would be to create a string array 255 long (one for each of the 256 possible mnemonics plus invalid instructions, use ERR or INV) and a corresponding numeric array with a code for the addressing mode. The

disassembler would then look at the first byte and get the mnemonic from the string array. Then, from the numeric array, extract a code which can be used to jump to a subroutine to extract the address and format the output to the screen. The subroutines you will need are, one for each addressing mode je Immediate. Zero page. Zero page X, Absolute, Absolute X, Absolute Y, (Indirect X), and (Indirect Y). In addition, you will need a routine for branches (and extra here would be to put labels in the output).

One thing to be aware of is that if you start disassembler in a random position, say in the middle of data, the output will not make a great deal of sense and you will get either a number of invalid codes, or gibberish. There are a number of books that will provide the appropriate descriptions, values, addressing modes etc for 65402, one such being 6502 User's manual by Joseph J Carr from Prentice Hall. I hope there is enough information here to enable you to get to get a bit further with your program.

By the way, the same method can be used for any microprocessor so if you need a disassembler for the Z80, just follow the same system, it's only a little more complex.

Muddled by MUD

M Saunders, of Cannock, Staffs writes:

Q I have just obtained a modem for my computer and have heard about an adventure called the Multi User Dungeon. Could you give me details on how to get in touch with it, and how much it costs.'

MUD is run by a department A of British Telecom called New Information Services. You can have a quick go on MUD by dialling 01-997 9433 for 300/300 baud moderns, or 01-998 8899 for 1200/75. When the system asks you for your identity, type in MUDGUEST and then enter the password PROSPECT. The system is only available from 1800 to 0750 hours which is, perhaps, a vain attempt to help you keep your telephone charges down. It costs about £1.75 an hour to play and there is a joining fee as well. There are occasionally special offers on this fee. If you want to join, write to MUSE Ltd, 6 Albermarle Way, London EC1V.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Kenn Garroch and every week he will Poke back as many answers as he can. The address is Peek & Poke, PCW, 12-13 Little Newport Street, London WC2R 3LD

LIMITED AMOUNT SO PLEASE ORDER EARLY

SEND FOR AMSTRAD BUSINESS SOFTWARE LIST. ORDER EARLY TO AVOID DISAPPOINTMENT

FACULTY ENTERPRISES LTD 29 Rutland Court, Ponders End Enfield, Middx EN3 4BJ 01-805 8054

Check out these offers on top quality dot matrix printers. All the models offered are substantially reduced from the normal high street prices. Prices are fully inclusive of VAT, delivery and lead to sult any computer with centronics parallel printer port. eg. Amstrad, 8.8.C.; Ensein, Atar ST, Oric, Dragon, Memotech or MSX. For the CBM 64/128 we supply a user port centronics cable. For Spectrum or QL owners an appropriate interface is supplied for an extra £20.00, for Atari models other than the ST an extra £30.00. Delivery is by insured receipted delivery and orders are despatched the next working day after receipt, provided we have stock.

SHINWA/MICRO P. CPA 80 + NOW WITH NEAR LETTER QUALITY MODE

Improved specification makes this the latest version of this popular model, the outstanding printer buy in it's class. As well as it's normal superb print quality at 100cps (better than the NLQ on many rival models) it now has an NLQ mode which offers even better print quality. This can be switched in either from a front panel NLO switch or from software. Other res are friction and tractor feed, external dipswitch, graphics mode, square needle print head (gives less dotty look to print) and Epson compatibility. Take a look at these

New NLQ PICA print style Standard PICA text (100cps) True descenders on jpg etc. ELITE mode gives 96 columns CONDENSED mode gives 142 columns ENLARGED mode SUBSCRIPTS and SUPERSCRIPTS underlines nicely Good italic character set

We are convinced that this printer offers the best performance and value in its class and at our unheard of price is a BARGAIN.

ONLY £189.95

Price includes Centronics lead to suit your micro Or to suit Spectrum with Kempston "E" Interface £209.95.

PANASONIC KX P1080

Now available at a really competitive price. This printer has a R.R.P. of £245 + VAT. Features are, 100cps: Friction and tractor feed; easy access "dip switches"; easy change long life ribbon and superb switch selectable NLQ mode

A sample of the impressive N.L.Q. from the Panasonic KX P1080 N.L.Q. available in Elite (12cpi) and italic modes.

Superb value from Evesham Micros High quality from Panasonic Two names you can trust

ONLY £199.95

Price includes Centronics lead to suit your micro.
Or to suit Spectrum with Kempston "E" Interface £219.95

Locoscript Wordcount on Amstrad PCW

by Peter Worlock

The accompanying utility provides a simple word count for Locoscript files of up to 6,600 lines – about 100 pages.

The file to be checked should be saved in ASCII format (make a copy of the file because Locoscript will not reload ASCII files). You should then load and run Basic, followed by this program.

It recognises words by trailing spaces and tabs. Lines 180-220 do the checking, discounting double spaces and tabs, and blank lines.

Obviously it's a lot of hassle for short files but for longer documents, it saves time and is accurate to about one per cent.

The £ symbol on line 110 should be a # incidently.

```
10 FOR i = 1 TO 10; down$ = down$+CHR$(10); NEXT
20 home$ = CHR$(27)+"H'
30 cls = CHR$(27)+"E"+CHR$(27)+"H"
40 PRINT c1$
50 INPUT "Which file"; file$
60 DIM word$(6600)
70 OPEN "i", 1, file$
80 entries = 0
90 WHILE NOT(EDF(1))
100 entries = entries + 1
110 INPUT £1, word$(entries)
120 WEND
130 CLOSE 1
140 words = 0
150 FOR i = 0 TO entries
160 IF LEN(word$(i)) = 0 THEN 250
170 FOR j = 1 TO LEN(word$(i))
180 t$ = MID$(word$(i),j,1)
190 t1$ = MID$(word$(i),j+1,1)
200 IF t$ < CHR$(33) AND t1$ < CHR$(33) THEN 220
210 IF t$ < CHR$(33) THEN words = words + 1
220 NEXT j
230 words = words + 1
240 PRINT home$ down$ "Total words = " words
250 NEXT i
```

Hires on C64

by David McGlynn

The following program when run and called via a Sys 49152 command, will place the C64 into high resolution mode.

The screen starts at 8192 decimal or 2000 hex. It finishes at 16191 decimal or 3F3F hex.

To change the address of the screen just Poke 49153, low byte of address, and Poke 49158, high byte of address.

The screen colour can be changed from cyan to whatever you wish by using Poke 49210, no 0-15 and Poke 49227, name same number.

```

Programming: Atari

Graph-ST

by Wail Sabbagh

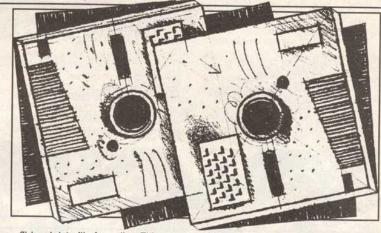

ere is part two of the three week Graph-ST listing plus instructions for using the data entry menu.

This menu is concerned with defining or loading the data file format, and offers the following options -

1) Define data from keyboard. This option must be selected by first time users as there is no data file yet stored on the disc. Once selected the following information is requested:

a) Number of blocks required (maximum of five). Each block can be analysed separately or with a combination of other blocks

b) The name of each block.

2) Load data file from disc. This option loads a previously defined data file into

All options are selected by clicking the mouse in the option box.

Hi-res window on the C64

by Neil Kendall

he following subroutine will set up a high resolution window in the top third of the screen. This is useful for applications such as adventure games where text and graphics have to be displayed simultaneously. The hi-res memory is in the normal position of 8192 onwards and colour information is stored in screen memory 1024 onwards. The machine code is initialised by using Gosub 60000 and called by Sys 49152.

The size of the window can be altered by poking different numbers into location 49240.

UXB game on Spectrum

by Ian Grainger

n this entertaining arcade style game you play the part of Dynamite Dave who has been hired by the local council to defuse the bombs in the YTS Training Centre. To do this you must collect the bombs, of which there are five on each floor of the building.

Over the ten floors are distributed a number of hazards, from the remains of previous defusees to a worm that appears after four levels. The worm can help as well as hinder because it leaves a block behind as it chases you around the screen.

Also, gravestones pop up from time to time, just to confuse matters. Full instructions are given in the program which will be presented over three weeks.

Should you not feel up to the task of typing it all in then send £2 to lan Grainger, 33 Wellfield Road, Wingate, County Durham TS28 5LA and he'll send you a copy.

7-13 AUGUST 1986

The software house: skill or chance?

David C Ridge finishes a two-part series of advice to potential entrepreneurs

he single most important factor in the sales of your product is the quality and quantity of your advertising. Sure, it's nice to have a great product, but if nobody knows about it, how will they buy it?

However, advertising will not make people buy your product if they have no need or want for that product. But good advertising informs people who already want such a product, where they can get it and why yours is better. And don't worry about how saturated the market might be with similar products; there is always room for the best, so make sure that yours is.

It is vital to accurately assess the latest trends and prejudices in the market. If the buying public has recently had a bad experience with a similar product then your product, no matter how good, will feel the brunt of the prejudice.

In most cases this will be decided by which machine the people involved have experience with. However, in the unlikely event that you have a choice to make, then make the decision based on the active installed user base. This is not to be confused with how many machines have been sold. The real question is: how many

machines have been sold in the market you wish to address and how many are still being used?

No one would deny that the Spectrum is incredibly popular and the number of publications which cater to its users would seem to verify that. The same goes for Amstrad and Commodore. Some people claim that certain obscure computers are much more popular than they really are. How many Enterprise publications are there?

This underscores a point I made earlier about knowing the market you wish to address. It's entirely possible that a particular computer is phenomenally popular in another country but has not caught on where you are. This will be reflected by the publications available locally.

Predicting the way a market will go and then charting your business course accordingly is the fastest way I can think of to go broke. After considerable experience and observation, I have no choice but to turn a wonderful and historical phrase coined by Sir Winston Churchill – The computer industry is a riddle, wrapped in mystery, inside an enigma! You have no more chance of predicting the outcome of

the introduction of a new machine than you have of predicting when the post will arrive (or if it will arrive).

Think about some recent events. Was it logical to introduce the Spectrum+ with no joystick port, no sound and a tacky keyboard? Was it logical that Sinclair, at the time a major force in world computing, would introduce a business computer with a squidgy keyboard, finicky mass-storage and 128K Ram?

Is it logical that Commodore, with arguably the largest installed user base in the world, should be having financial difficulties? Is it logical that the Apple II, which was designed in 1976, is still selling today? I'm just trying to emphasise a point. Sure, looking at it logically, the Atari ST seems to have all the right ingredients to become an overwhelming success. But that doesn't mean a thing.

So in conclusion, I will say that if it sounds appealing to you to risk it all, work yourself unconscious and then be left scratching your head at the end of the day, then starting a software house could be for you. But there's no doubt about it – you'll be working in a house of cards.

DIGITAL INTEGRATION · DIGITAL INTEGRATION · DIGITAL

PROGRAMMERS

Digital Integration specialises in producing high quality real-time simulations for the home computer market.

We are now looking for good machine code programmers to join our in-house development team currently working on a range of interesting and challenging projects. Applicants must be able to demonstrate a thorough understanding of machine-code development on Z80, 6502 or 68000. Creative talent, self-motivation and a strong interest in home computers are

essential. Salaries according to experience. Interested? If so, please send us your c.v. or call Dave Marshall on 0276 684959.
